

The History of Python Programming

History of Python Programming

Python was conceived in the late 1980s by Guido van Rossum at Centrum Wiskunde & Informatica (CWI) in the Netherlands. It was officially released in 1991 as a successor to the ABC language, with a primary focus on code readability and programmer productivity.

Over the decades, Python evolved through versions 2.0 and 3.0, becoming one of the most popular programming languages in the world. Its versatility and extensive library ecosystem have made it a cornerstone for fields such as data science, artificial intelligence, and web development.
